

**FEATHER ASSEMBLY FOR PREVENTING BIRDS FROM FLYING INTO  
WINDOWS AND ASSOCIATED METHOD OF USE**

**ABSTRACT OF THE DISCLOSURE**

A feather assembly prevents birds from flying into a glass window or door. The feather assembly comprises a length of line and a plurality of brightly colored feathers secured to the line at spaced locations. The feather assembly is secured over a glass window or door such that it sways from one side of the glass to the other in the wind. The bright colors, motion and birds' natural aversion to loose feathers scare wilds birds away from windows or doors.
